

Hype, quantified.

SoleSight watches 90 sneakers across 12 brands and answers one question, every night, with no human in the loop: how much does the market want each shoe right now? Live signals in, one explainable 0–100 Hype Score out — published to a public index with every number traceable to its source.

What it does

- Hype Score 0–100**
Weighted blend of five signals; weights renormalize over whatever is present. Fully explainable — the site recomputes today's #1 in front of you.
- Launch Radar**
Detects demand spikes (3x+ baseline) from the data itself and labels every shoe's lifecycle stage — emerging, peaking, cooling, dormant.
- Ask SoleSight**
An agentic analyst: Claude answers free-form questions by querying the index's data tools; a deterministic engine serves everyone else, keyless.
- Proof, in public**
A data-backed case study (an 8.9x surge caught at #1) with a forecast call graded on the page as data arrives.

How it runs — every night, unattended

The pipeline commits its data back to the repo — the commit history is a daily, public heartbeat.
